Topics

- Plain (vanilla) Recurrent Neural Network
- Problem of vanish gradients
- Long Short-Term Memory
- Gradient Recurrent Unit
- Example applications

Motivation

- We want to process a sequence of data like text, digitized speech, video frames, etc.
- Want past samples to influence output from current sample

Recurrent Neural Network

Recurrent Neural Network – Weight Matrices

Figure 9.2 Simple recurrent neural network illustrated as a feedforward network.

$$\mathbf{h}_t = g(\mathbf{U}\mathbf{h}_{t-1} + \mathbf{W}\mathbf{x}_t)$$

$$\mathbf{y}_t = f(\mathbf{V}\mathbf{h}_t)$$

Unrolled view over time

In this case you are emitting an output for every input token

Unrolled network is fed sequentially (not all at once)

Unrolled Network

Figure 9.4 A simple recurrent neural network shown unrolled in time. Network layers are recalculated for each time step, while the weights \mathbf{U} , \mathbf{V} and \mathbf{W} are shared across all time steps.

The weights, \mathbf{U} , \mathbf{W} and \mathbf{V} , are the same at each time step. Only the inputs (x_t , h_{t-1}) change.

Different RNN configurations

- (a) Regular Feed Forward Network
- (b) E.g. image captioning – input 1 image, outputs sequence of words
- (c) E.g. sentiment analysis from string of words or characters
- (d) E.g. machine translation such as English to French
- (e) Synced sequence input and output, e.g. video frame-by-frame action classification or text generation

RNN next letter prediction example

Output is probability or likelihood over the vocabulary

Hidden layer encodes history, here e.g. length 3.

One-hot encoded input of vocabulary length, e.g. ('h', 'e', 'l', 'o')

Training an RNN

```
import torch.nn as nn

class RNN(nn.Module):
    def __init__(self, input_size, hidden_size, output_size):
        super().__init__()

        self.hidden_size = hidden_size

        self.i2h = nn.Linear(input_size + hidden_size, hidden_size)
        self.h2o = nn.Linear(hidden_size, output_size)
        self.softmax = nn.LogSoftmax(dim=1)

    def forward(self, input, hidden):
        combined = torch.cat((input, hidden), 1)
        hidden = self.i2h(combined)
        output = self.h2o(hidden)
        output = self.softmax(output)
        return output, hidden

    def initHidden(self):
        return torch.zeros(1, self.hidden_size)
```

Simple feed forward network.

History and recurrence
managed outside the model

Training an RNN – Same Backprop as FFN

```
# If you set this too high, it might explode. If too low, it might not learn  
learning_rate = 0.005
```

```
def train(category_tensor, line_tensor):  
    hidden = rnn.initHidden()  
  
    rnn.zero_grad()  
  
    for i in range(line_tensor.size()[0]):  
        output, hidden = rnn(line_tensor[i], hidden)  
  
    loss = criterion(output, category_tensor)  
    loss.backward()  
  
    # Add parameters' gradients to their values, multiplied by learning rate  
    for p in rnn.parameters():  
        p.data.add_(p.grad.data, alpha=-learning_rate) # in-place addition  
  
    return output, loss.item()
```

Managing recurrence.

Single output for classification in this case.

“Back propagation Through Time”, e.g. BPTT

Loss Calculation for Sequence

$$L_{CE} = - \sum_{w \in V} \mathbf{y}_t[w] \log \hat{\mathbf{y}}_t[w]$$

$$L_{CE}(\hat{\mathbf{y}}_t, \mathbf{y}_t) = -\log \hat{\mathbf{y}}_t[w_{t+1}]$$

The probability that the model assigns to the next word in the training sequence.

Topics

- Plain (vanilla) Recurrent Neural Network
- Problem of vanish gradients
- Long Short-Term Memory
- Gradient Recurrent Unit
- Example applications

Problem of vanishing gradients

Tokens from earlier in the sequence can influence the current output

But for plain RNNs, the influence can reduce rapidly the further the sequence difference

Topics

- Plain (vanilla) Recurrent Neural Network
- Problem of vanish gradients
- Long Short-Term Memory
- Gradient Recurrent Unit
- Example applications

Redrawing RNN

Redraw the RNN in slightly more detail

Neural Network Layer:

$$h_t = \tanh(W \cdot [h_{t-1}, x_t] + b)$$

$\tanh()$, $\mathbb{R} \rightarrow [-1,1]$

First redraw RNN

The repeating module in a standard RNN contains a single layer.

Long Short Term Memory (LSTM)

The repeating module in an LSTM contains four interacting layers.

LSTM – Cell State

LSTM -- Forgetting Gate

$$f_t = \sigma (W_f \cdot [h_{t-1}, x_t] + b_f)$$

Decides what part of cell state to suppress

LSTM – Cell state update

Input Gate Layer

$$i_t = \sigma(W_i \cdot [h_{t-1}, x_t] + b_i)$$

$$\tilde{C}_t = \tanh(W_C \cdot [h_{t-1}, x_t] + b_C)$$

Candidate Cell State

LSTM – Apply changes to cell state

$$C_t = f_t * C_{t-1} + i_t * \tilde{C}_t$$

LSTM – Output and Hidden State Update

Output Gate

$$o_t = \sigma (W_o [h_{t-1}, x_t] + b_o)$$

$$h_t = o_t * \tanh (C_t)$$

Next hidden state and output

Long Short Term Memory (LSTM)

Neural Network Layer:

$$out_t = activation(W \cdot [h_{t-1}, x_t] + b)$$

[Illustrated Guide to LSTM's and GRU's, M. Phi Blog Post](#)

Topics

- Plain (vanilla) Recurrent Neural Network
- Problem of vanish gradients
- Long Short-Term Memory
- Gradient Recurrent Unit
- Example applications

Gradient Recurrent Unit

- Combines the forget and input gates into a single “update gate.”
- Merges the cell state and hidden state

The resulting model is simpler than standard LSTM models.

Results are mixed.

$$z_t = \sigma (W_z \cdot [h_{t-1}, x_t])$$

$$r_t = \sigma (W_r \cdot [h_{t-1}, x_t])$$

$$\tilde{h}_t = \tanh (W \cdot [r_t * h_{t-1}, x_t])$$

$$h_t = (1 - z_t) * h_{t-1} + z_t * \tilde{h}_t$$

The Unreasonable Effectiveness of Recurrent Neural Networks

May 21, 2015

Trained on complete works of Shakespeare

3-layer RNN with 512 hidden nodes on each layer.

Trained for a few hours on a GPU

PANDARUS:

Alas, I think he shall be come approached and the day
When little strain would be attain'd into being never fed,
And who is but a chain and subjects of his death,
I should not sleep.

Second Senator:

They are away this miseries, produced upon my soul,
Breaking and strongly should be buried, when I perish
The earth and thoughts of many states.

DUKE VINCENTIO:

Well, your wit is in the care of side and that.

Second Lord:

They would be ruled after this chamber, and
my fair nues begun out of the fact, to be conveyed,
Whose noble souls I'll have the heart of the wars.

Clown:

Come, sir, I will make did behold your worship.

VIOLA:

I'll drink it.

Deep Visual-Semantic Alignments for Generating Image Descriptions

Multimodal Recurrent Neural Network

Our Multimodal Recurrent Neural Architecture generates sentence descriptions from images. Below are a few examples of generated sentences:

"man in black shirt is playing guitar."

"construction worker in orange safety vest is working on road."

"two young girls are playing with lego toy."

"boy is doing backflip on wakeboard."

"girl in pink dress is jumping in air."

"black and white dog jumps over bar."

"young girl in pink shirt is swinging on swing."

"man in blue wetsuit is surfing on wave."

Figure 4. Diagram of our multimodal Recurrent Neural Network generative model. The RNN takes a word, the context from previous time steps and defines a distribution over the next word in the sentence. The RNN is conditioned on the image information at the first time step. START and END are special tokens.

The Unreasonable Effectiveness of Recurrent Neural Networks

Inductive Reasoning, Memories and Attention.

• • •

The first convincing example of moving towards these directions was developed in DeepMind's [Neural Turing Machines](#) paper. This paper sketched a path towards models that can perform read/write operations between large, external memory arrays and a smaller set of memory registers (think of these as our working memory) where the computation happens. Crucially, the NTM paper also featured very interesting memory addressing mechanisms that were implemented with a (soft, and fully-differentiable) attention model. The concept of **soft attention** has turned out to be a powerful modeling feature and was also featured in [Neural Machine Translation by Jointly Learning to Align and Translate](#) for Machine Translation and [Memory Networks](#) for (toy) Question Answering. In fact, I'd go as far as to say that

*The concept of **attention** is the most interesting recent architectural innovation in neural networks.*
