# Pre-Training

# The GPT-3 dataset was 499 billion tokens

Dataset	Quantity (tokens)	Weight in Training Mix	Epochs Elapsed when Training for 300B Tokens
Common Crawl (filtered)	410 billion	60%	0.44
WebText2	19 billion	22%	2.9
Books1	12 billion	8%	1.9
Books2	55 billion	8%	0.43
Wikipedia	3 billion	3%	3.4

Language Models are Few-Shot Learners (2020), <https://arxiv.org/abs/2005.14165>

# Llama 1 was trained on 1.4T tokens

Dataset	Sampling prop.	Epochs	Disk size
CommonCrawl	67.0%	1.10	3.3 TB
C4	15.0%	1.06	783 GB
Github	4.5%	0.64	328 GB
Wikipedia	4.5%	2.45	83 GB
Books	4.5%	2.23	85 GB
ArXiv	2.5%	1.06	92 GB
StackExchange	2.0%	1.03	78 GB

Table 1: **Pre-training data.** Data mixtures used for pre-training, for each subset we list the sampling proportion, number of epochs performed on the subset when training on 1.4T tokens, and disk size. The pre-training runs on 1T tokens have the same sampling proportion.

LLaMA: Open and Efficient Foundation Language Models (2020), <https://arxiv.org/abs/2302.13971>

## Llama 2 was trained on 2T tokens

“Our training corpus includes a new mix of data from publicly available sources, which does not include data from Meta’s products or services. We made an effort to remove data from certain sites known to contain a high volume of personal information about private individuals. We trained on 2 trillion tokens of data as this provides a good performance–cost trade-off, up-sampling the most factual sources in an effort to increase knowledge and dampen hallucinations.”

Llama 2: Open Foundation and Fine-Tuned Chat Models (2023), <https://arxiv.org/abs/2307.09288>

## Llama 3 was trained on 15T tokens

“To train the best language model, the curation of a large, high-quality training dataset is paramount. In line with our design principles, we invested heavily in pretraining data. Llama 3 is pretrained on over 15T tokens that were all collected from publicly available sources.”

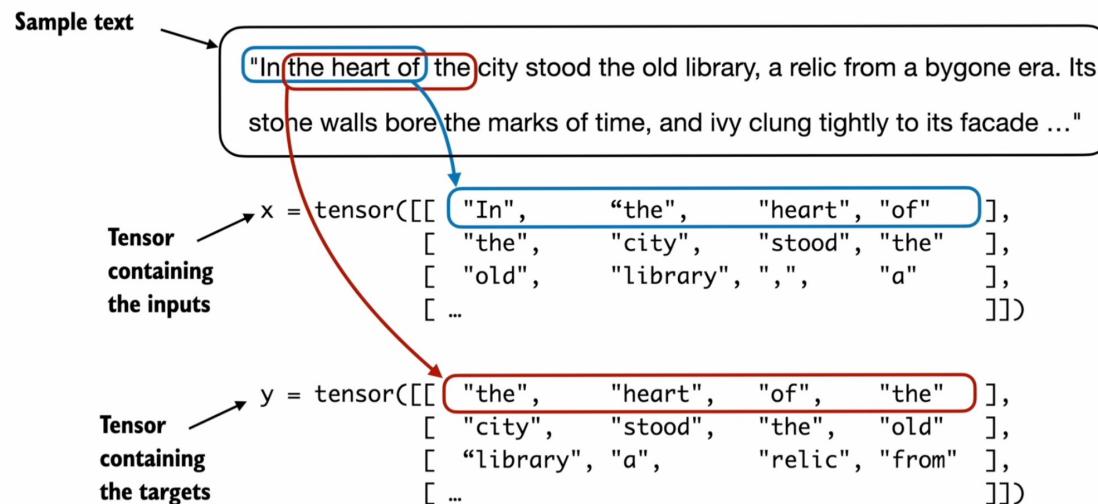

Introducing Meta Llama 3: The most capable openly available LLM to date (2024), <https://ai.meta.com/blog/meta-llama-3/>

## Quantity vs quality

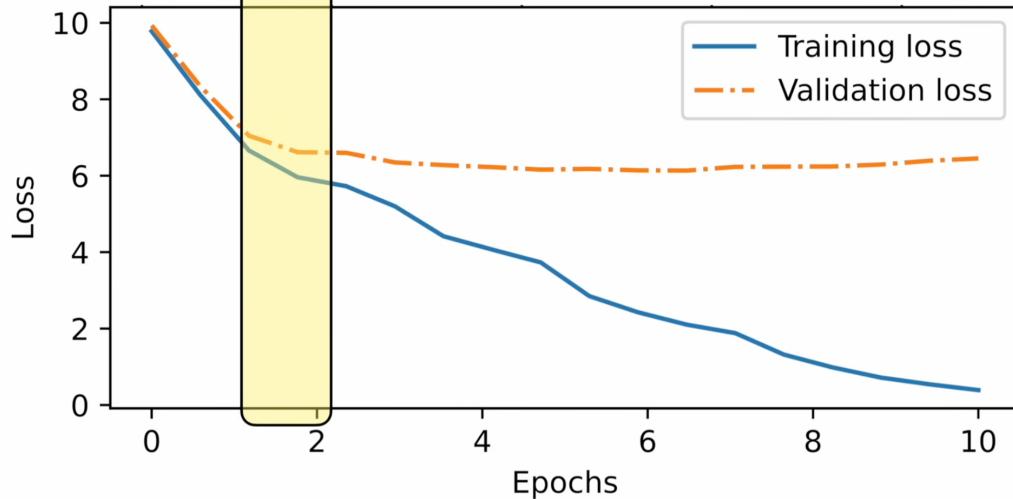

“we mainly focus on the **quality of data** for a given scale. We try to calibrate the training data to be closer to the “data optimal” regime for small models. In particular, we filter the publicly available web data to contain the correct level of “knowledge” and keep more web pages that could potentially improve the “reasoning ability” for the model. As an example, **the result of a game in premier league in a particular day might be good training data for frontier models, but we need to remove such information to leave more model capacity for “reasoning” for the mini size models.**

# LIMA: Finetuning with only 1K instructions

< Papers arxiv:2305.11206

## LIMA: Less Is More for Alignment

Published on May 18, 2023 · Submitted by akhalig on May 21, 2023 #1 Paper of the day

Authors: Chunting Zhou, Pengfei Liu, Puxin Xu, Srinivas Iyer, Jiao Sun, Yuning Mao, Xuezhe Ma, Avia Efrat, Ping Yu, Lili Yu, Susan Zhang, Gargi Ghosh, Mike Lewis, Luke Zettlemoyer, Omer Levy

### Abstract

Large language models are trained in two stages: (1) unsupervised pretraining from raw text, to learn general-purpose representations, and (2) large scale instruction tuning and reinforcement learning, to better align to end tasks and user preferences. We measure the relative importance of these two stages by training LIMA, a 65B parameter LLaMa language model fine-tuned with the standard supervised loss on only 1,000 carefully curated prompts and responses, without any reinforcement learning or human preference modeling. LIMA demonstrates remarkably strong performance, learning to follow specific response formats from only a handful of examples in the training data, including complex queries that range from planning trip itineraries to speculating about alternate history. Moreover, the model tends to generalize well to unseen tasks that did not appear in the training data. In a controlled human study, responses from LIMA are either equivalent or strictly preferred to GPT-4 in 43% of cases; this statistic is as high as 58% when compared to Bard and 65% versus DaVinci003, which was trained with human feedback. Taken together, these results strongly suggest that almost all knowledge in large language models is learned during pretraining, and only limited instruction tuning data is necessary to teach models to produce high quality output.

The screenshot shows the Datasets page for the LIMA dataset. At the top, there are links for 'Papers' and 'arxiv:2305.11206'. The main title is 'Datasets: GAIR/lima' with a like count of 430 and a follow button. Below the title, there are filters for 'Modalities: Text', 'Size: 1K - 10K', 'ArXiv: arxiv:2305.11206', 'Libraries: Datasets, Croissant', and 'License: other'. There are also tabs for 'Dataset card', 'Data Studio', 'Files and versions', and 'Community'. The 'Dataset Viewer' section shows a table with a single row labeled 'conversations' under the 'source' column, which is a 'string · classes' type. The table contains several rows of text prompts and their sources, mostly from stackexchange. The bottom of the viewer has navigation buttons for 'Previous', '1', '2', '3', '...', '11', 'Next'.

# Refine responses for style or safety

## Reward preferred responses

### **Input Prompt:**

"What are the key features to look for when purchasing a new laptop?"

#### **Answer 1: Technical Response**

"When purchasing a new laptop, focus on key specifications such as the processor speed, RAM size, storage type (SSD vs. HDD), and battery life. The processor should be powerful enough for your software needs, and sufficient RAM will ensure smooth multitasking. Opt for an SSD for faster boot times and file access. Additionally, screen resolution and port types are important for connectivity and display quality."

#### **Answer 2: User-Friendly Response**

"When looking for a new laptop, think about how it fits into your daily life. Choose a lightweight model if you travel frequently, and consider a laptop with a comfortable keyboard and a responsive touchpad. Battery life is crucial if you're often on the move, so look for a model that can last a full day on a single charge. Also, make sure it has enough USB ports and possibly an HDMI port to connect with other devices easily."

# Generative LLM Evaluations

Evaluate for

- Accuracy (is it factual or hallucinated?)
- Relevance (is it answering the question?)
- Bias, Toxicity (Is it fair? Or even worse is it racist or toxic?)
- Diversity of Response (does it always give same response? or equally useful diverse responses?)

# Ways to Evaluate

- Find a benchmark that matches your task
  - HellaSwag (*which evaluates how well an LLM can complete a sentence*),
  - TruthfulQA (*measuring truthfulness of model responses*), and
  - MMLU (*which measures how well the LLM can multitask*),
  - WinoGrande (*commonsense reasoning*),
  - GSM8K, (*arithmetic reasoning*), etc.
- Create your own evaluation prompt/response pairs –
  - need thousands!
- Use an LLM to evaluate your LLM!

See: <https://arize.com/blog-course/llm-evaluation-the-definitive-guide/> for a nice overview

# HF OpenLLM leaderboard became too easy Models plateaued

Top Scores and Human Baseline Over Time (from last update)

<https://huggingface.co/spaces/open-llm-leaderboard/blog>

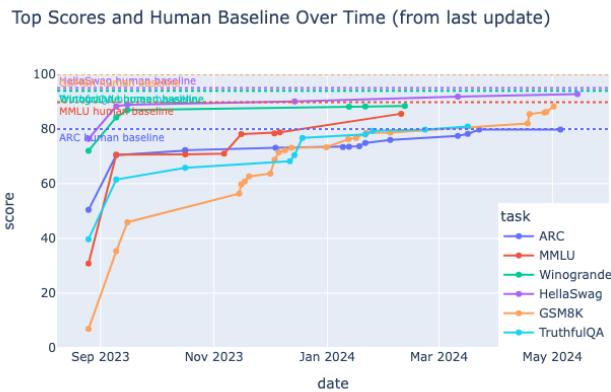

# HF OpenLLM leaderboard became too easy Models plateaued

1. They became too easy for models. For instance, models are now reaching baseline human performance on HellaSwag, MMLU, and ARC, a phenomenon called saturation.
2. Some newer models also showed signs of contamination. By this, we mean that models were possibly trained on benchmark data or on data very similar to benchmark data. As such, some scores stopped reflecting the general performance of the model and started to overfit on some evaluation datasets instead of reflecting the more general performance of the task being tested. This was, in particular, the case for GSM8K and TruthfulQA, which were included in some instruction fine-tuning sets.

Some benchmarks contained errors. MMLU was recently investigated in depth by several groups (see [MMLU-Redux](#) and [MMLU-Pro](#)), which surfaced mistakes in its responses and proposed new versions. Another example was that GSM8K used a specific end-of-generation token (:), which unfairly pushed down the performance of many verbose models.

We thus chose to completely change the evaluations we are running for the Open LLM Leaderboard v2!

# Crowd-Sourcing Evaluations

## User Feedback

Expand to see the descriptions of 30 models

Model A

What's the best way to evaluate LLM Q&A systems?

The best way to evaluate Legal Language Model (LLM) Q&A systems is by using a combination of quantitative and qualitative methods. Here are some key evaluation metrics and approaches:

1. Accuracy: Measure the correctness of the LLM's answers to specific legal questions. You can use a pre-defined dataset of legal questions and answers or create your own dataset. Compare the LLM's answers to the correct answers and calculate the accuracy.
2. Precision, Recall, and F1-score: Assess the LLM's ability to provide relevant information and filter out irrelevant information. Precision measures the percentage of relevant answers among all the answers provided, recall measures the percentage of relevant answers identified, and the F1-score is the harmonic mean of precision and recall.
3. Answer Confidence: Evaluate the LLM's confidence in its answers by analyzing the model's probability scores. This can help identify questions where the model may need further training or the answers may need additional verification.
4. Response Time: Measure how quickly the LLM can generate answers

A is better      B is better      Tie      Both are bad

# lmsys.org evolved

The screenshot shows the LMSYS Org website. On the left is a sidebar with the logo "LMSYS ORG" and links to "Projects", "Blog", "About", "Donations", and "Chatbot Arena". The main content area features a large image of a nebula or galaxy. Overlaid on this is the text "LMSYS Org" and a subtitle: "The Large Model Systems Organization develops large models and systems that are open, accessible, and scalable." To the right of the main image is a grid of eight project cards:

- Vicuna**: A chatbot impressing GPT-4 with 90%\* ChatGPT quality, available in 7B/13B/33B sizes.
- Chatbot Arena**: Scalable and gamified evaluation of LLMs via crowdsourcing and Elo rating systems.
- SGLang**: A fast serving engine for LLMs and VLMs.
- LMSYS-Chat-1M**: A large-scale real-world LLM conversation dataset.
- FastChat**: An open platform for training, serving, and evaluating LLM-based chatbots.
- MT-Bench**: A set of challenging, multi-turn, and open-ended questions for evaluating chatbots.
- Arena Hard Auto**: An automatic pipeline converting live data to high-quality benchmarks for evaluating chatbots.
- RouteLLM**: An open-source framework for serving and evaluating LLM routers.

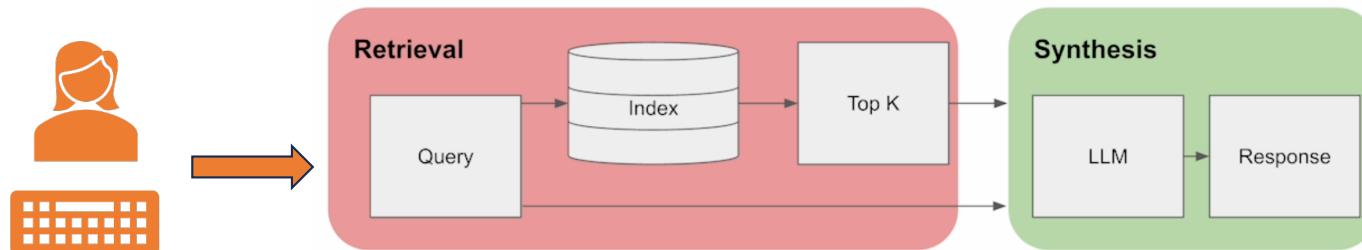

# Topics

- Generative LLM flow and how to evaluate
- Improve LLM performance by prompting strategies
- **Improving with retrieval augmentation**
- Building more complex systems with LLMs: "Cognitive Architectures"

# Retrieval-Augmented Generation (RAG)

RAG enhances LLMs by referencing external knowledge to generate relevant responses.

- Integrates external data into LLM text generation.
- Reduces hallucination, improves response relevance.
- Works with
  - Unstructured data (e.g. documents)
  - Structured data (e.g. SQL data)
  - Code (e.g. python)

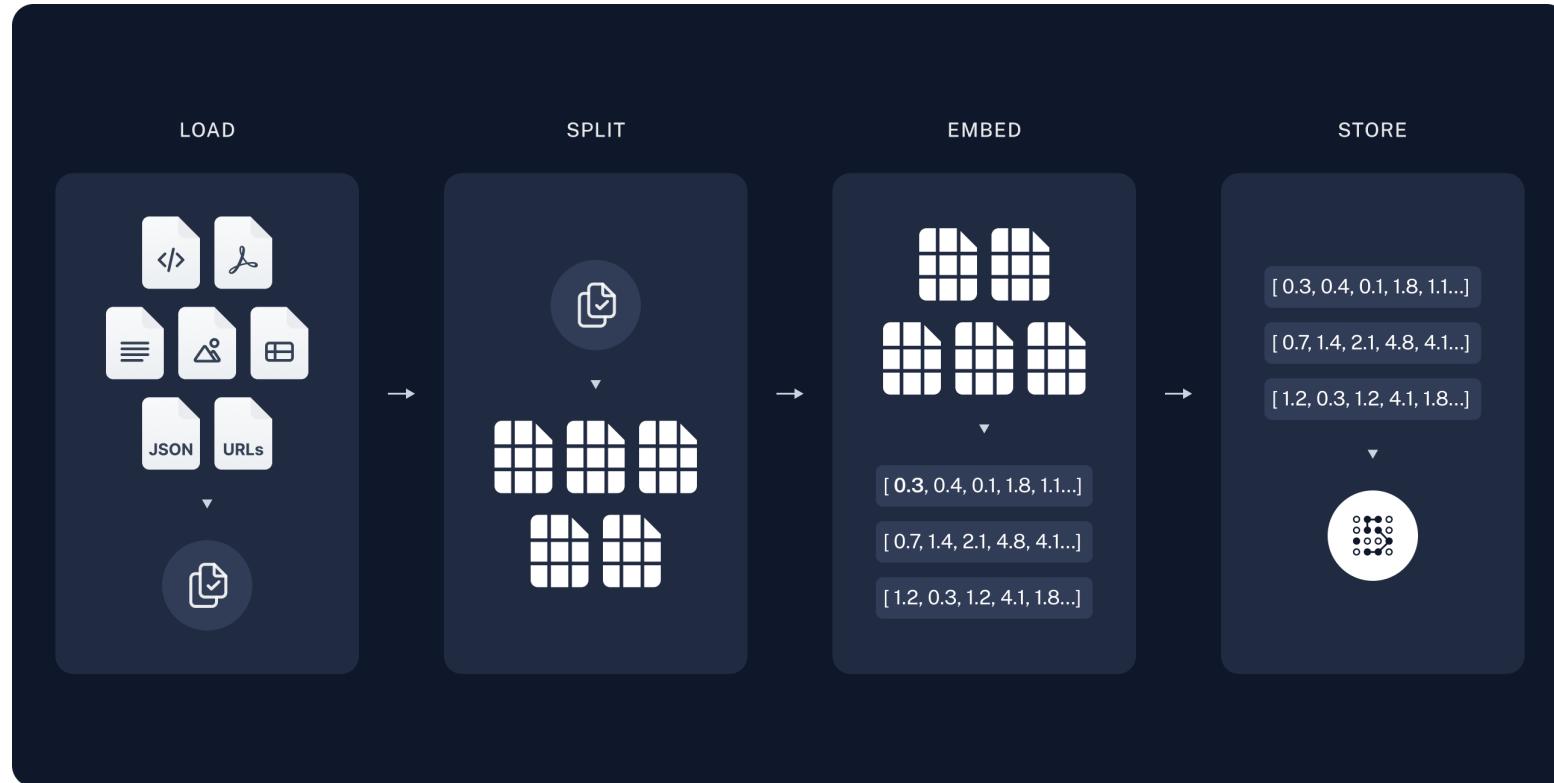

# RAG Architecture

Typical RAG application has two main components:

- Loading and Indexing:
  - A pipeline for ingesting data from a source and indexing it
  - Usually happens offline
- Retrieval and Generation:
  - Takes user query at run time and retrieves relevant data from the index and passes it to the model

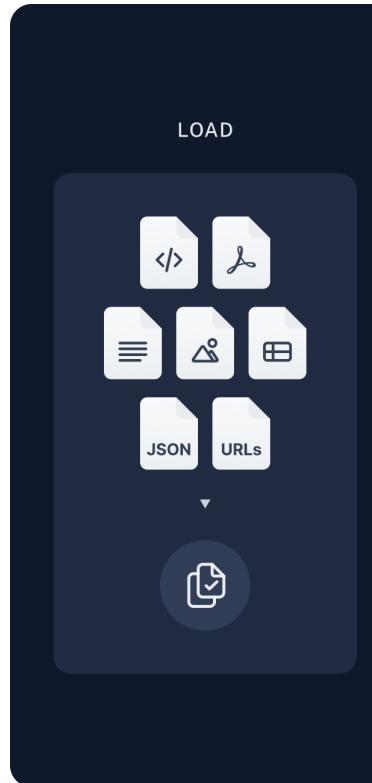

[https://python.langchain.com/docs/use\\_cases/question\\_answering/](https://python.langchain.com/docs/use_cases/question_answering/)

# RAG – Loading and Indexing

[https://python.langchain.com/docs/use\\_cases/question\\_answering/](https://python.langchain.com/docs/use_cases/question_answering/)

# RAG – Load

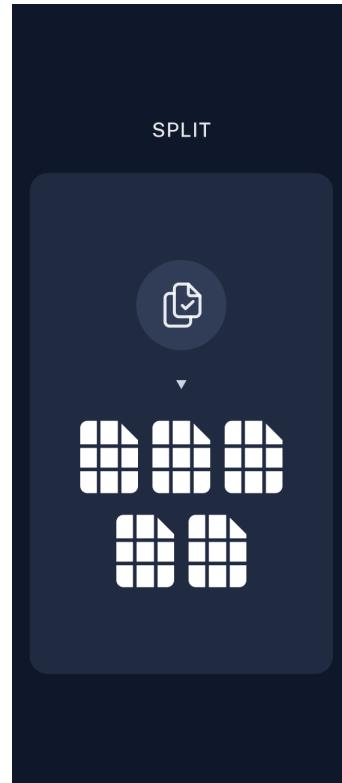

Load the data, e.g.

- PDFs
- HTML
- Plain text
- Images, video, audio
- Structured data (SQL, CSV/TSV, ...)
- JSON
- URLs
- ...

See for example: [https://python.langchain.com/docs/modules/data\\_connection/document\\_loaders/](https://python.langchain.com/docs/modules/data_connection/document_loaders/)

[https://python.langchain.com/docs/use\\_cases/question\\_answering/](https://python.langchain.com/docs/use_cases/question_answering/)

# RAG – Split

Break large documents into smaller chunks.

Easier to:

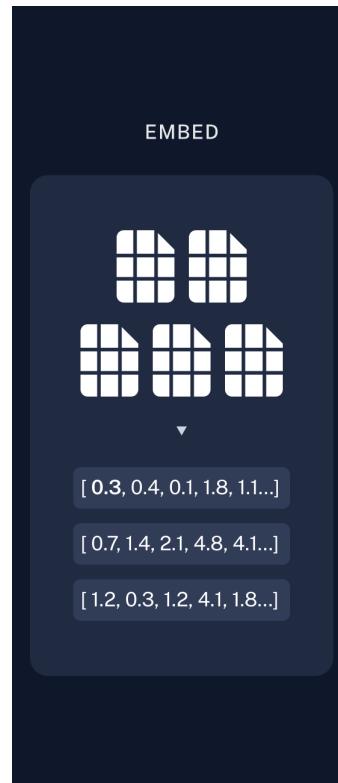

- index
- pass to model
- search
- fit into model's context window

See for example: [https://python.langchain.com/docs/modules/data\\_connection/document\\_transformers/](https://python.langchain.com/docs/modules/data_connection/document_transformers/)

[https://python.langchain.com/docs/use\\_cases/question\\_answering/](https://python.langchain.com/docs/use_cases/question_answering/)

# RAG – Embed

- **Encode** (e.g. with Byte Pair Encoding) and
- **Transform** to embedding vectors with the learned embedding model.

See for example: [https://python.langchain.com/docs/modules/data\\_connection/text\\_embedding/](https://python.langchain.com/docs/modules/data_connection/text_embedding/)

[https://python.langchain.com/docs/use\\_cases/question\\_answering/](https://python.langchain.com/docs/use_cases/question_answering/)

# RAG – Store

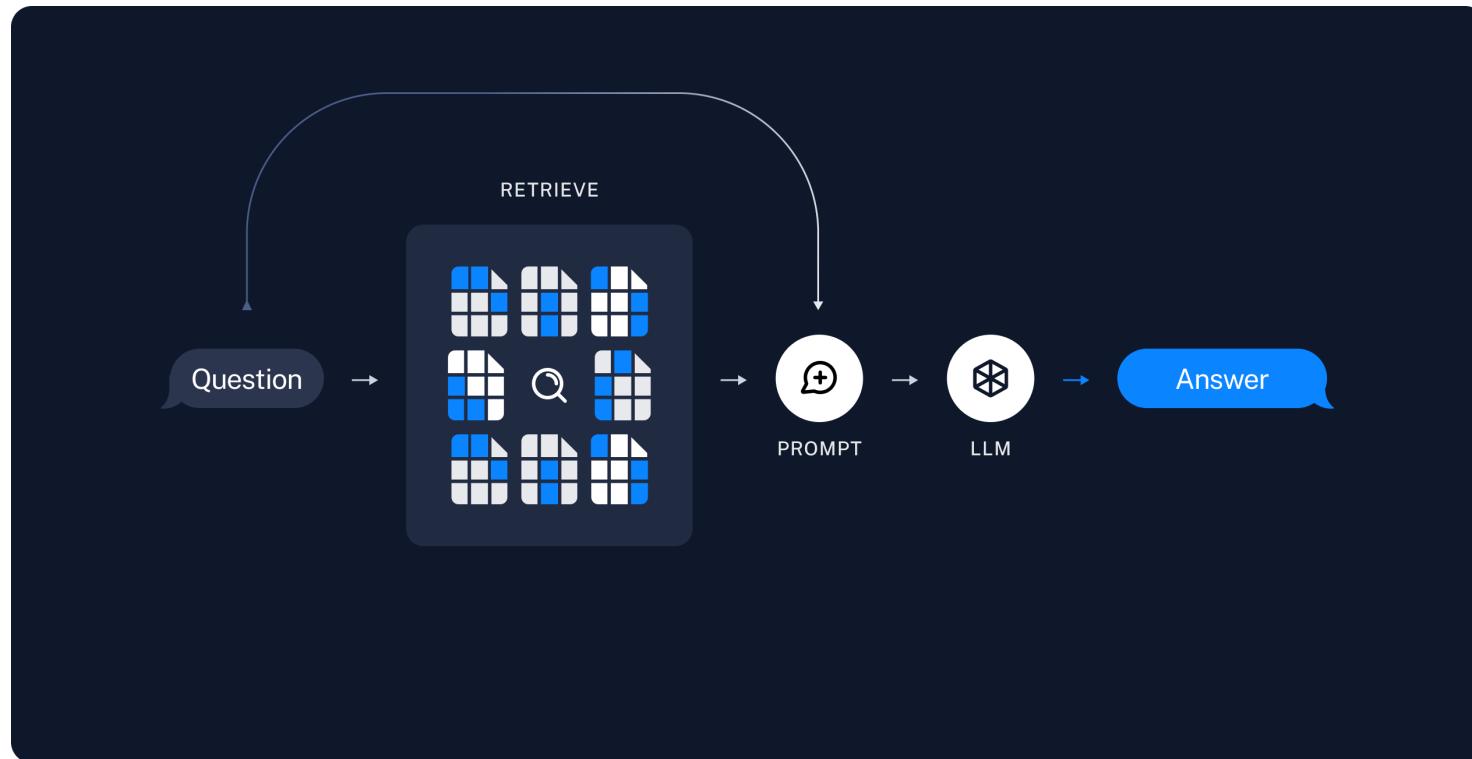

- Store the data in some kind of Vector Store
- e.g. Chroma, FAISS, Lance, Pinecone, etc...

See for example: [https://python.langchain.com/docs/modules/data\\_connection/vectorstores/](https://python.langchain.com/docs/modules/data_connection/vectorstores/)

[https://python.langchain.com/docs/use\\_cases/question\\_answering/](https://python.langchain.com/docs/use_cases/question_answering/)

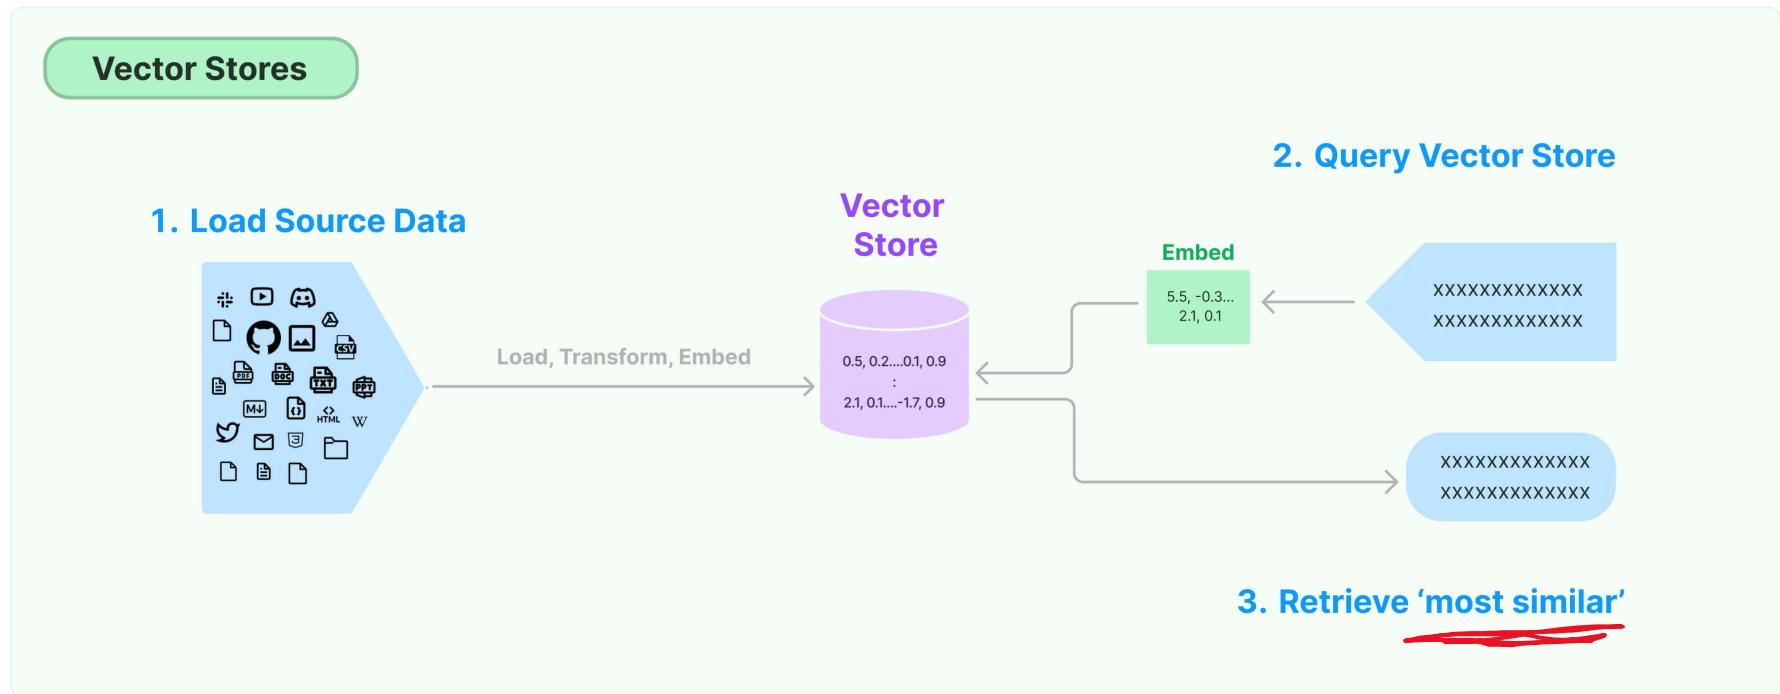

# RAG – Retrieval and Generation

[https://python.langchain.com/docs/use\\_cases/question\\_answering/](https://python.langchain.com/docs/use_cases/question_answering/)

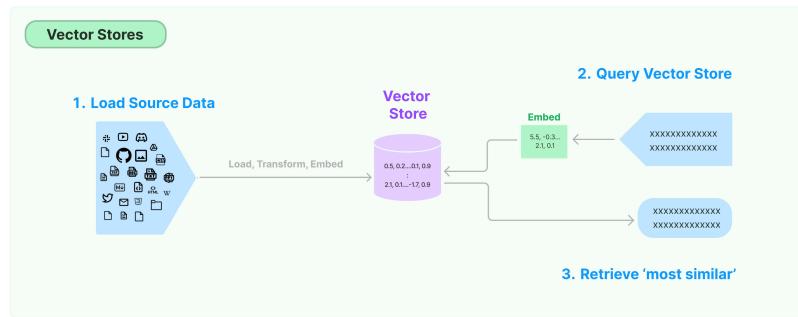

50

# RAG – Retrieval

[https://python.langchain.com/docs/modules/data\\_connection/vectorstores/](https://python.langchain.com/docs/modules/data_connection/vectorstores/)

# RAG – Retrieval Similarity Measure

$$\text{L2 Norm*}: d = \sum_i (A_i - B_i)^2$$

$$\text{Inner Product: } d = 1 - \sum_i (A_i \times B_i)$$

$$\text{Cosine Similarity: } 1 - \frac{\sum_i (A_i \times B_i)}{\sqrt{\sum_i (A_i^2)} \sqrt{\sum_i (B_i^2)}}$$

Is simple similarity measure  
between query and document  
the best approach?

# RAG – Other Query-Document Matching Approaches

## 1. BERT and Variants for Query-Document Matching

### **BERT:**

Devlin, J., Chang, M. W., Lee, K., & Toutanova, K. (2018). BERT: Pre-training of Deep Bidirectional Transformers for Language Understanding. arXiv:1810.04805. *This foundational paper introduces BERT and its methodology for language understanding, which has been widely applied to information retrieval tasks.*

### **Application in Information Retrieval:**

Nogueira, R., & Cho, K. (2019). Passage Re-ranking with BERT. arXiv:1901.04085. *This work explores how BERT can be used for re-ranking search results, demonstrating its effectiveness in improving information retrieval systems.* <https://arxiv.org/abs/1901.04085>

## 2. Fine-tuning for Specific Tasks

### **Fine-Tuning BERT for Search:**

MacAvaney, S., Cohan, A., & Goharian, N. (2019). CEDR: Contextualized Embeddings for Document Ranking. SIGIR. *This paper discusses fine-tuning BERT with contextual embeddings specifically for document ranking, providing insights into adapting Transformer models for search tasks.* <https://dl.acm.org/doi/abs/10.1145/3331184.3331317>

## 3. Dual-encoder and Cross-encoder Architectures

### **Dual-Encoders for Efficient Retrieval:**

Karpukhin, V., Oğuz, B., Min, S., Lewis, P., Wu, L., Edunov, S., Chen, D., & Yih, W. (2020). Dense Passage Retrieval for Open-Domain Question Answering. EMNLP. This paper introduces a method using dense vector representations for passages and questions to improve open-domain question answering. <https://arxiv.org/abs/2004.04906>

### **Cross-Encoders for Detailed Similarity Scoring:**

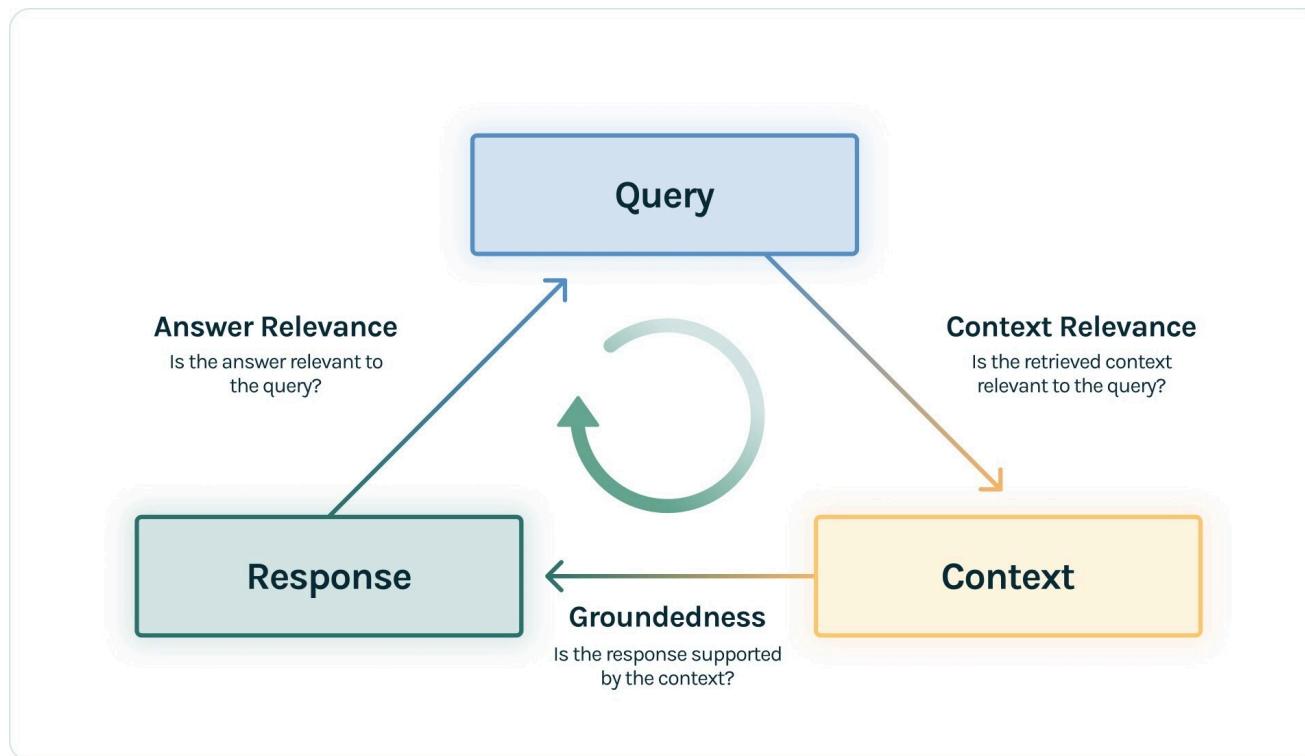

Humeau, S., Shuster, K., Lachaux, M. A., & Weston, J. (2019). Poly-encoders: Transformer Architectures and Pre-training Strategies for Fast and Accurate Multi-sentence Scoring. arXiv:1905.01969. The poly-encoder architecture introduced here incorporates aspects of both dual and cross-encoders, offering a balance between speed and accuracy for matching tasks. <https://arxiv.org/abs/1905.01969>

## 4. Semantic Search Systems

### **Semantic Search with Transformers:**

Guo, J., Fan, Y., Pang, L., Yang, L., Ai, Q., Zamani, H., Wu, C., Croft, W. B., & Cheng, X. (2020). A Deep Look into Neural Ranking Models for Information Retrieval. Information Processing & Management. This review covers deep learning approaches to information retrieval, including the use of Transformer models for understanding query intent and document relevance in a semantic search context. <https://www.sciencedirect.com/science/article/pii/S0306457319302390>

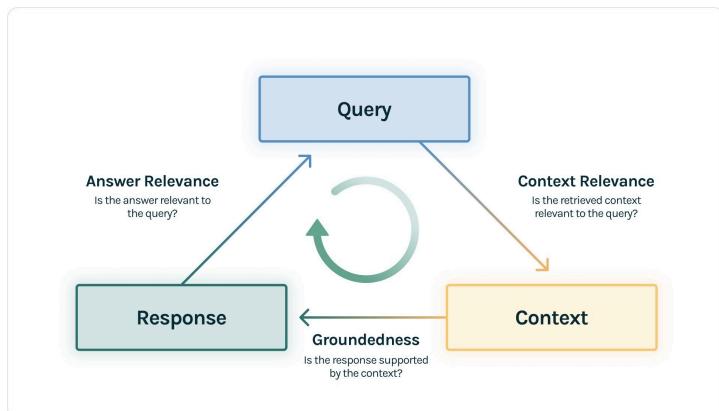

# Evaluating RAG-based LLMs

[https://www.trulens.org/trulens\\_eval/getting\\_started/core\\_concepts/rag\\_triad/](https://www.trulens.org/trulens_eval/getting_started/core_concepts/rag_triad/)

# Evaluating RAG: Context Relevance

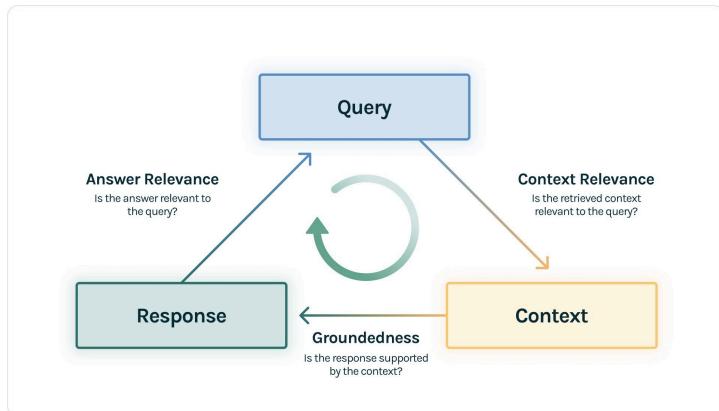

- Is the content retrieved from the vector database relevant to the query?
- Irrelevant information will be likely integrated into the response, contributing to hallucinations

[https://www.trulens.org/trulens\\_eval/getting\\_started/core\\_concepts/rag\\_triad/](https://www.trulens.org/trulens_eval/getting_started/core_concepts/rag_triad/)

# Evaluating RAG: Groundedness

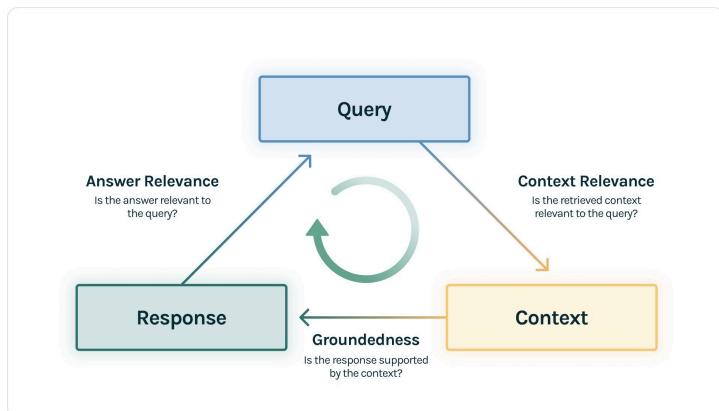

- The context was provided to the LLM as part of the prompt
- Did the LLM response incorporate the context appropriately?
- Can we support each claim in the response from the context?

[https://www.trulens.org/trulens\\_eval/getting\\_started/core\\_concepts/rag\\_triad/](https://www.trulens.org/trulens_eval/getting_started/core_concepts/rag_triad/)

# Evaluating RAG: Answer Relevance

- Is the answer relevant to the original question?
- Prompt is augmented with context.
- Did the context cause the LLM to stray away from the question?

[https://www.trulens.org/trulens\\_eval/getting\\_started/core\\_concepts/rag\\_triad/](https://www.trulens.org/trulens_eval/getting_started/core_concepts/rag_triad/)

## Evaluate and Track LLM Applications

Evaluate, iterate faster, and select your best LLM app with TruLens.

# Retrieval-Augmented Generation (RAG)

RAG systems have evolved from Naive RAG to Advanced RAG and Modular RAG. This evolution has occurred to address certain limitations around performance, cost, and efficiency.

## Pre-Retrieval Improvements

- Enhance indexed data quality, optimize chunk size and overlap.
- Rewrite user queries for better match in vector database.
- Use metadata and pronoun replacement to maintain context in chunks.

## Retrieval Enhancements

- Explore alternative search methods (e.g., full-text, graph-based).
- Experiment with different embedding models for task suitability.
- Implement hierarchical and recursive search for precision.

## Post-Retrieval Optimization

- Re-rank or score chunks for relevance; compress information from multiple chunks.
- Employ smaller, faster models for specific steps to reduce latency.
- Parallelize intermediate steps and use caching for common queries.

## Balancing Quality and Latency

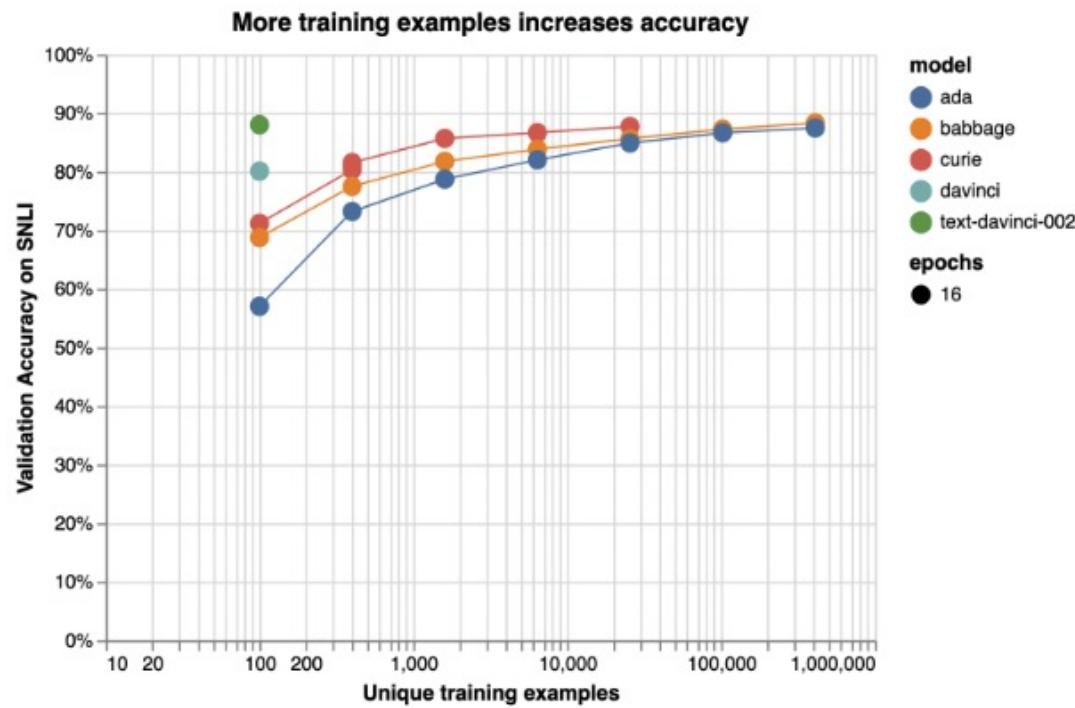

- Opt for parallel processing, smaller models, and caching strategies.
- Tailor RAG approach based on the complexity of user queries and the nature of tasks.

<https://www.promptingguide.ai/research/rag>

# Model Finetuning

- Large foundation models are pre-trained on general tasks
- Might not do as well on specialized tasks
  - Try prompt engineering and retrieval augmentation first
- Good news: can fine tune model with much smaller dataset to adapt to downstream tasks
- Fine tuned model is same size as original.
  - Resource Intensive: Can take very large memory and compute resources to fine tune
  - Storage Demands: If you have  $n$  downstream tasks, you will have  $n$  copies of your large model.

# Full Finetuning Example

Text classification performance on the [Stanford Natural Language Inference \(SNLI\) Corpus](#). Ordered pairs of sentences are classified by their logical relationship: either contradicted, entailed (implied), or neutral. Default fine-tuning parameters were used when not otherwise specified.

# HuggingFace – Fine-tune Pretrained Model Tutorials

- Finetune for Sentiment Analysis Example (broken??)
  - <https://huggingface.co/docs/transformers/training>
  - Finetune [bert-base-cased](#) (109M params, FP32, 436MB) on Yelp review dataset (650K reviews, 323 MB)
- Finetune for text classification example
  - [https://github.com/huggingface/notebooks/blob/main/examples/text\\_classification.ipynb](https://github.com/huggingface/notebooks/blob/main/examples/text_classification.ipynb)
  - preprocess the data and fine-tune a pretrained model on any GLUE task
- Finetune for question answering
  - [https://github.com/huggingface/notebooks/blob/main/examples/question\\_answering.ipynb](https://github.com/huggingface/notebooks/blob/main/examples/question_answering.ipynb)
  - preprocess the data and fine-tune a pretrained model on SQuAD

# Model Finetuning Drawbacks

- Fine tuned model is same size as original.
  - **Resource Intensive**: Can take very large memory and compute resources to fine tune
  - **Storage Demands**: If you have  $n$  downstream tasks, you will have  $n$  copies of your large model

# Model Finetuning Drawbacks

- Fine tuned model is same size as original.
  - **Resource Intensive**: Can take very large memory and compute resources to fine tune
  - **Storage Demands**: If you have  $n$  downstream tasks, you will have  $n$  copies of your large model

Solution is to update aspects of the model, rather than entire model

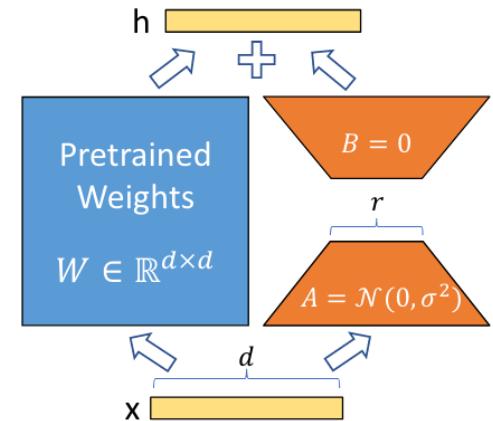

- Low rank adaptation of the weight updates -- LoRA
- Train and concatenated soft prompts -- Prompt Tuning

# Topics

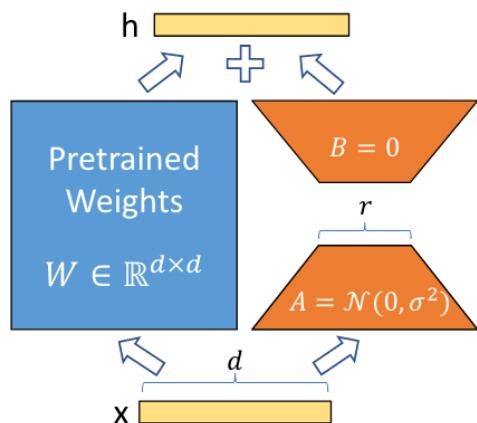

- Full finetuning
- Low rank adaptation
- Prompt tuning

# Low Rank Adaptation

- Deploying independent instances of downstream fine-tuned models can be prohibitive (e.g. GPT3, 175B params, 700GB@fp32)
- Instead, freeze the pre-trained model and inject *trainable rank decomposition matrices* into each layer
- Reduce trainable parameters by 10,000x!!
- On-par or better than finetuning on RoBERTa, DeBERTa, GPT-2 and GPT-3

# Low Rank Adaptation

- Aghajanyan et al show that pretrained language models have a low “intrinsic dimension”
- Updates to weight matrices likely have a low “intrinsic rank” during training
- Found that even very low rank (e.g.  $r=1$  or 2) with GPT-3 175B is effective where full rank (embedding dimension) is 12,288

E. J. Hu *et al.*, “LoRA: Low-Rank Adaptation of Large Language Models.” arXiv, Oct. 16, 2021. <http://arxiv.org/abs/2106.09685>

A. Aghajanyan et al., “Intrinsic Dimensionality Explains the Effectiveness of Language Model Fine-Tuning”. arXiv:2012.13255 [cs], December 2020. URL <http://arxiv.org/abs/2012.13255>.

## Reminder: Rank of a Matrix

- The number of linearly independent rows or columns of a matrix
- Determines the dimension of the vector space spanned by the column vectors
- A measure of “dimensionality”

# LoRA: Method

Say you have pre-trained weights,

$$W_0 \in \mathbb{R}^{d \times k}$$

Represent update with a low rank decomposition

$$W_0 + \Delta W = W_0 + BA ,$$

where  $B \in \mathbb{R}^{d \times r}$ ,  $A \in \mathbb{R}^{r \times k}$  and the rank  $r \ll \min(d, k)$ , is much less than the full rank.

For updates,

$$h = (W_0 + \Delta W)x = W_0x + \Delta Wx = W_0x + BAx$$

Initialize A to random gaussian and B to zero

Say you have pre-trained weights,

$$W_0 \in \mathbb{R}^{d \times k}$$

Represent update with a low rank decomposition

$$W_0 + \Delta W = W_0 + BA ,$$

where  $B \in \mathbb{R}^{d \times r}$ ,  $A \in \mathbb{R}^{r \times k}$  and the rank  $r \ll \min(d, k)$ , is much less than the full rank.

For updates,

$$h = (W_0 + \Delta W)x = W_0x + \Delta Wx = W_0x + BAx$$

Initialize A to random gaussian and B to zero

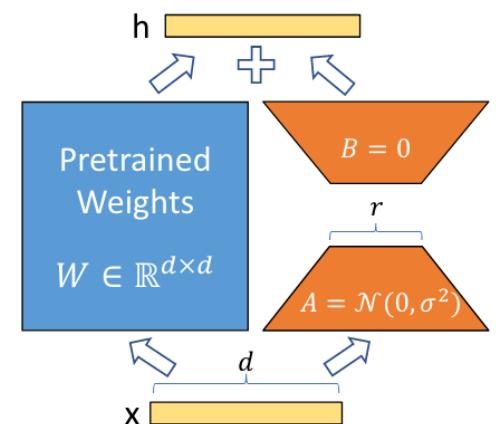

# LoRA: Method

LoRA can be viewed as a generalization of full finetuning, since using full rank = full finetuning

Updates:

$$h = (W_0 + \Delta W)x = W_0x + \Delta Wx = W_0x + BAx$$

Generally only applied to  $W_q$  and  $W_v$  matrices.

GPT-2 medium (M) and large (L) with different adaptation methods on the E2E NLG Challenge. For all metrics, higher is better. LoRA outperforms several baselines with comparable or fewer trainable parameters. Confidence intervals are shown for experiments we ran. \* indicates numbers published in prior works.

# Understanding the Low-Rank Updates

1. Given a parameter budget constraint, which subset of weight matrices in a pre-trained Transformer should we adapt to maximize downstream performance?
2. Is the “optimal” adaptation matrix  $\Delta W$  really rank-deficient? If so, what is a good rank to use in practice?

# 1) Which weight matrices to target?

# of Trainable Parameters = 18M							
Weight Type	$W_q$	$W_k$	$W_v$	$W_o$	$W_q, W_k$	$W_q, W_v$	$W_q, W_k, W_v, W_o$
Rank $r$	8	8	8	8	4	4	2
WikiSQL ( $\pm 0.5\%$ )	70.4	70.0	73.0	73.2	71.4	<b>73.7</b>	<b>73.7</b>
MultiNLI ( $\pm 0.1\%$ )	91.0	90.8	91.0	91.3	91.3	91.3	<b>91.7</b>

Validation accuracy on WikiSQL and MultiNLI after applying LoRA to different types of attention weights in GPT-3, given the same number of trainable parameters. Adapting both  $W_q$  and  $W_v$  gives the best performance overall. We find the standard deviation across random seeds to be consistent for a given dataset, which we report in the first column.

Rank of 16 on 2 matrices or even 4 on 4 matrices is sufficient.

## 2) What is the optimal rank?

	Weight Type	$r = 1$	$r = 2$	$r = 4$	$r = 8$	$r = 64$
WikiSQL( $\pm 0.5\%$ )	$W_q$	68.8	69.6	70.5	70.4	70.0
	$W_q, W_v$	73.4	73.3	73.7	73.8	73.5
	$W_q, W_k, W_v, W_o$	74.1	73.7	74.0	74.0	73.9
MultiNLI ( $\pm 0.1\%$ )	$W_q$	90.7	90.9	91.1	90.7	90.7
	$W_q, W_v$	91.3	91.4	91.3	91.6	91.4
	$W_q, W_k, W_v, W_o$	91.2	91.7	91.7	91.5	91.4

“Validation accuracy on WikiSQL and MultiNLI with different rank  $r$ . To our surprise, a rank as small as one suffices for adapting both  $W_q$  and  $W_v$  on these datasets while training  $W_q$  alone needs a larger  $r$ .”
